Product Description

An aqueous quality control material for monitoring the measurement of pH, PCO₂, PO₂, Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, Glucose (Glu) and Lactate (Lac) for use with Nova Biomedical analyzers ONLY. Formulated at three levels:

CONTROL 1 Acidosis, with High Electrolyte, Low Normal Glucose, Normal Lactate
CONTROL 2 Normal pH, Low-Normal Hct, Normal Electrolyte, High Glu, High Lac
CONTROL 3 Alkalosis, High Hct, Low Electrolyte, High Abnormal Glu, High Abnormal Lac

Intended Use Methodology

Refer to Stat Profile pHox Plus M Analyzer Instructions For User Manual.

Composition

A buffered bicarbonate solution, each control with a known pH and known levels of Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, Glu and Lactate. Solutions are equilibrated with known levels of O₂, CO₂ and N₂. The reagent characteristics give a signal that is equivalent to a known hematocrit value in a whole blood. Molt inhibition. Each ampule contains 1.7 ml volume. Contains no constituents of human origin, however, good laboratory practice should be followed during handling of these materials. (REF. NCCLS DOCUMENT M29-T2).

Warnings and Cautions:

Must be stored at 24 - 26°C for at least 24 hours before opening. Intended for in vitro diagnostic use. Refer to the Stat Profile pHox Plus M Analyzer Instructions for USE for complete directions for use, including application of the test control sample onto the analyzer, recommendations for use of controls, troubleshooting information and methodology and principles of the testing procedures. Follow standard practices required for handling laboratory reagents. Once ampule is opened, discard unused portion in accordance with local guidelines.

Storage

Store at 15-30°C; DO NOT FREEZE. Expiration date is printed on each ampule container. Do not store unused opened ampules.

Directions for use

Contents must be shaken well prior to use. Controls must be stored at approximately 24-26°C for at least 24 hours prior to opening. Refer to Analyzer Instructions for USE for complete instructions. Verify that the lot number appearing on the Expected Ranges Table is the same lot number indicated on the control ampule.

Limitations

PO₂ values vary inversely with temperature (approximately 1% / °C).

The Expected Range values are specific for instruments and controls manufactured by Nova Biomedical.

Traceability of Standards

Analytes are traced to NIST Standard Reference Materials.

Reference Intervals

Controls are formulated to represent three pH levels (Acidosis, Normal pH, and Alkalosis).

The expected clinical range of values for these analytes in patient blood is referenced in Tietz, N.W. ed 1986 Textbook of Clinical Chemistry, W.B. Saunders Co.

Users may wish to determine MEAN VALUES and EXPECTED RANGES in their own laboratory.¹

Expected Ranges

The EXPECTED RANGE for each analyte was determined at Nova Biomedical by using multiple runs of each level of control at 37°C on multiple instruments. THE EXPECTED RANGE indicates the maximum deviations from the mean value that may be expected under different laboratory conditions for instruments operating at 37°C. For more information, refer to the Expected Ranges Table.

Conversion Factors: For Ca⁺⁺: Glucose, Lactate, and Mg⁺⁺:

Ca⁺⁺ in mmol/L x 4 = mg/dL

Glucose in mg/dL x 18.016 = mmol/L

Lactate in mmol/L x 8.9 = mg/dL

Mg⁺⁺ in mmol/L x 2.43 = mg/dL

¹How to Define and Determine Reference Intervals in the clinical laboratory; approved guideline-second edition, NCCLS C28-A2, Volume 20, Number 13.

Descripción del producto

Un control de calidad acuoso para supervisar la medición de pH, PCO₂, PO₂, Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, Glucosa (Glu) y Lactato (Lac) para usar con analizadores de Nova Biomedical EXCLUSIVAMENTE. Formulado en tres niveles:

CONTROL 1	Acidosis, con electrolitos altos, glucosa normal baja, lactato normal
CONTROL 2	pH normal, Hct bajo-normal, con electrolitos normales, glucosa alta, lactato alto
CONTROL 3	Alcalosis, Hct alto, con electrolitos bajos, glucosa normal alta, lactato anormal alto

Uso indicado

Para uso diagnóstico in vitro para supervisar el desempeño de los analizadores Stat Profile pHOx Plus M de Nova Biomedical.

Metodología

Consulte el manual de instrucciones de uso del analizador Stat Profile pHOx Plus M.

Composición

Una solución de bicarbonato de bicarbonato, en la que cada control tiene un pH conocido y niveles conocidos de Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, Glucosa (Glu) y Lac. Las soluciones se equilibran con niveles conocidos de O₂, CO₂ y N₂. As características de reflectividad dan una señal que es equivalente a un valor de hematocrito conocido en sangre entera. No forma foto. Cada ampolla contiene un volumen de 1,7 mL no contiene ninguna sustancia de origen humano; sin embargo, deben seguirse las prácticas laboratorias adecuadas al manipular estos materiales. (REF. DOCUMENTO NCCLS M29-T2).

Advertencias y precauciones:

Debe almacenarse a 24 - 26°C durante los menos 24 horas antes de abrir. Indicado para uso diagnóstico in vitro. Consulte las instrucciones de uso de los analizadores Stat Profile pHOx Plus M para obtener instrucciones de uso y recomendaciones para la aplicación del control, información sobre resolución de fallas, metodología y principios de los procedimientos de prueba. Siga las normas estándar requeridas para la manipulación de reactivos de laboratorio. Una vez abierta una ampolla, deseche la parte no utilizada de acuerdo con las normas locales.

Almacenamiento

Almacenamiento a 15-30°C; NO CONGELAR. La fecha de vencimiento está impresa en el envase de cada ampolla. No hay ampollas no utilizadas que estén abiertas.

Instrucciones de uso

El contenido debe almacenarse antes de usar. Los controles deben almacenarse a aproximadamente 24 - 26°C durante los menos 24 horas antes de abrir. Para obtener las instrucciones completas, consulte las instrucciones de uso del analizador. Verifique que el número de lote que aparece en la Tabla de gamas esperadas sea el mismo número de lote indicado en la ampolla de control.

Limitaciones

Los valores de PO₂ varían en proporción inversa a la temperatura (aproximadamente 1% / °C). Los valores de la gama esperada son exclusivos de instrumentos y controles fabricados por Nova Biomedical. Rastreo de normas Los análisis se rastrean según los materiales de referencia estándar de NIST. Intervalos de referencia Las concentraciones se formulan de manera tal que representen tres niveles de pH (acidosis, pH normal y alcalosis). La gama clínica separada de los valores de estos análisis en el sangre de los pacientes se incluye en el NIST, N.W. ed 1986 Textbook of Clinical Chemistry, W.B. Saunders Co. Es posible que los usuarios deseen determinar VALORES MEDIOS y GAMAS ESPERADAS en su propio laboratorio.¹ Gamas esperadas La GAMAS ESPERADA para cada análisis fue determinada en Nova Biomedical realizando análisis múltiples de cada nivel de control a 37°C en instrumentos múltiples. La GAMAS ESPERADA indica las desviaciones máximas del valor medio que pueden esperarse bajo condiciones de laboratorio diferentes para instrumentos que funcionan dentro de las especificaciones. Consulte la Tabla de gamas esperadas. Factores de conversión: Para Ca⁺⁺, Glucosa, Lactato y Mg⁺⁺. Ca⁺⁺ en mmol/L x 4 = mg/dL Glucosa en mg/dL x 18,016 = mmol/L Lactato en mmol/L x 8,9 = mg/dL Mg⁺⁺ en mmol/L x 2,43 = mg/dL

¹Cómo definir y determinar intervalos de referencia en el laboratorio clínico; norma aprobada-segunda edición, NCCLS C28-A2, Volumen 20, Número 13.

Description du produit

Produit de contrôle aquose pour surveiller les mesures de pH, PCO₂, PO₂, Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, glucose (Glu) et lactate (Lac) à utiliser avec les analyseurs Nova Biomedical UNIQUEMENT. Formulé à trois niveaux :

CONTROL 1	Acidose, avec électrolyte élevé, glucose basse normale, lactate normal
CONTROL 2	pH normal, basse-normale en Hct, avec électrolyte normal, glucose élevé, lactate élevé
CONTROL 3	Alcalose, teneur élevée en Hct, avec électrolyte bas, glucose élevé anormal, lactate élevé anormal

Utilisation prévue

Pour diagnostic in vitro afin de surveiller la performance des analyseurs Stat Profile pHOx Plus M de Nova Biomedical.

Méthodologie

Voir le manuel d'utilisation de l'analyseur Stat Profile pHOx Plus M.

Composition

Une solution de bicarbonate tamponnée, chaque contrôle, avec un pH connu et des niveaux connus de Na⁺, CO₂ et N₂. Les caractéristiques de reflectivité sont équivalentes avec des niveaux connus de O₂, CO₂ et N₂. Les caractéristiques de reflectivité donnent une signal équivalent à une valeur d'hématoctitre connue dans le sang entier. Moisissures inhibées. Chaque ampoule contient un volume de 1,7 mL. Ne contenir aucun matériau d'origine humaine; sin embargo, deben seguirse las prácticas laboratorias adecuadas al manipular estos materiales. (REF. DOCUMENTO NCCLS M29-T2).

Advertencias y precauciones:

Descrizione del prodotto

Prodotto di controllo aquoso per monitoraggio ai fini del monitoraggio della misurazione di pH, PCO₂, PO₂, Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, glucosio (Glu) e lattato (Lac) a utilizzare con gli analizzatori Nova Biomedical UNIQUAMENTE. Formulato a tre livelli:

CONTROL 1	Acidosi, con elettroliti alti, glucosio normale basso, lattato normale
CONTROL 2	pH normale, basse-normale in Hct, con elettroliti normali, glucosio elevato, lattato elevato
CONTROL 3	Alcalosi, Hct alto, con elettroliti bassi, glucosio anomalo alto, lattato anomalo alto

Finalità d'uso

Per uso diagnostico in vitro ai fini del monitoraggio delle prestazioni degli analizzatori Nova Biomedical Stat Profile pHOx Plus M.

Metodologia

Vedere il Manuale per l'uso degli analizzatori Stat Profile pHOx Plus M.

Composizione

Una soluzione di bicarbonato tamponata, ciascun controllo, con un pH noto y con livelli noti di Na⁺, K⁺, Ca⁺⁺, Mg⁺⁺, Glu e Lac. Le soluzioni sono equilibrate con livelli noti di O₂, CO₂ e N₂. Le caratteristiche di riflettanza sono equivalenti con un valore noto di ematocrito nel sangue intero. Non contiene mufie. Ogni fiale contiene 1,7 mL. Non contiene costituenti di origine umana; sin embargo, deben seguirse las prácticas laboratorias durante el manejo de estos materiales. (REF. DOCUMENTO NCCLS M29-T2).
